

X-ray protective screens

These protective screens are manufactured from a series of solid panels, with a lead core, faced on both sides with an attractive plastic laminate. An extensive range of colours is available.

The panoramic style lead glass windows give an excellent view of the patient.

Screens are available in sizes to suit individual requirements. A Radiation Protection Adviser should determine the lead thickness, which will normally be one of the following: -

- Code 4 1.80mm lower lead panel with 1.5mm Pb equivalent lead glass window
- Code 5 2.24mm lower lead panel with 2.1mm Pb equivalent lead glass window
- Code 6 2.65mm lower lead panel with 2.5mm Pb equivalent lead glass window
